Anabolic-Androgrnic Bi-Phasis Stack (Lean Mass)

Products:

18 mL methenolone enanthate 100 mg/mL
50 mL boldenone undecylenate 50 mg/mL
20 mL testosterone (enanthate or cypionate) 200 mg/mL
Estrogen Support: [Tamoxifen](#) (20-40 mg/day)

Comment:

This is a 3-month non-[liver](#)-toxic [cycle](#) that has 2 distinct phases, mass and lean mass/cutting. The first 6 weeks of training and diet are focused on mass building. Significant estrogenicity will be present in these weeks, and may necessitate the use of tamoxifen to prevent gynecomastia and excessive water retention. Estrogen maintenance drugs may be reduced or possibly eliminated after the start of phase 2, which focuses on increasing the androgen to estrogen ratio and solidifying the muscle mass. A maintenance dosage of testosterone remains during this second phase, in a effort to prevent sexual dysfunction or loss of libido, which often occurs with the use of predominantly anabolic steroids alone.

Dosage:

Week	Testosterone	Boldenone	Methenolone
------	------------------------------	---------------------------	-----------------------------

Â

Package content:

Name	Amount
Testosterone Enanthate 250mg/vial (10 vials)	1
